Evaluation of antioxidant effect and anticancer activity against human glioblastoma (U373MG) cell lines of Murraya Koenigii

Mrinal Sanaye and Nimisha Pagare

INTRODUCTION

Oxidative Stress is involved in the process of development of cancer and tumors. ROS formed due to oxidative stress can damage the macromolecules such as lipids, which react with metals (such as free iron and copper) and produce aldehydes such as malondialdehyde. This can induce mutations or cause breaks in the double chain, produce modifications in guanine and thymine bases, and sister chromatid exchanges, which can result in the signals of cell death and in cell cycle control. 1 Chemotherapy as well as radiotherapy for cancer treatment is associated with induction of oxidative stress leading to apoptosis which results in severe side effects. This arises a need for utilizing antioxidant potential of phytochemicals of plant origin for effective management of cancer.

Murraya koenigii Linn (Rutaceae) commonly known as curry leaf, is an aromatic more or less deciduous shrub tree commonly used in Indian diet. 2 Leaves contain alkaloids such as girinimbim, iso-mahanimbin, koenine, koenigine, koenidine and koenimbine, Mahanimbin and bicyclomahanimbicine. 3,4,5 Leaves are reported to possess antioxidant, antibacterial, antifungal, larvicidal, anticarcinogenic, hypoglycemic, hypolipidemic and antithrombotic activity. 6 The carbazole alkaloids mahanine, pyrafoline-D and murrafoline-I have reported to possess antioxidant and antipyretic activity. 7-9 Leaves contain anthraquinones, steroids, flavonoids, glycosides, saponins, alkaloids, coumarins, terpenoids and tannins. 7,10,11 Several biological activities of M. koenigii have been reported. 7,11,12 It has been used in treatment of hypertension, diarrhea, dysentery, fever, jaundice. 7,11 It contains chlorophyll and acts as an antihypertensive agent. 13 Experiments have been conducted on the plants using various extracts or drugs. 14 Experiments were conducted using chemical extracts and the results were analyzed. Upon analysis, it was found that the chemical extracts have different effects on the cell lines. 15

Glioblastoma multiforme is the most common and deadliest of malignant primary brain tumor in adults and is one of a group of tumors referred to as gliomas. The treatment for glioblastoma mainly includes surgery with radiotherapy and chemotherapy options are rarely available. Therefore, in the present study we have analyzed extracts and alkaloid fractions of Murraya koenigii leaves for their in vitro antioxidant and anticancer activity against glioblastoma U373MG cell lines.

MATERIAL AND METHODS

Chemicals

1. 1-diphenyl-2-picryl-hydrazyl (DPPH), Potassium ferricyanide ([K₃Fe(CN)₆]), Trichloroacetic acid (TCA), Ferric chloride (FeCl₃), Sodium dodecyl sulphate (SDS), Thiobarbituric acid (TBA), Nitroblue tetrazolium (NBT), Nicotinamine adenine dinucleotide (NADH), Phenazine methosulphate (PMS), Ethylene diamine tetracetic acid (EDTA), Hydrogen peroxide (H₂O₂) were purchased from Loba chemicals.

Plant material

Leaves of Murraya koenigii (MK) were collected from Kurla market, Mumbai. The plant (specimen#: np140104) was authenticated at Guru Nanak Khalsa College, Department of Botany, Mumbai.

Preparation of plant extracts and fractions

Fresh leaves were air dried, powdered mechanically and passed through 40#. Powdered plant material was extracted in a Soxhlet apparatus using 90% (v/v) ethanol and 100% methanol as solvents to obtain ethanolic extract (EEMK) and methanolic extract (MEMK) respectively. Distillate obtained was heated on a water bath to obtain a dry semisolid paste. Alkaloid fractions were separated from extracts. 10 The dry extracts and their fractions were stored in air-tight containers at 2-4°C for further experimental use.

ABSTRACT

Aim: The main aim of the study was to screen the ethanolic (EEMK) and methanolic (MEMK) extracts of Murraya koenigii (MK) leaves and their alkaloid fractions (EFMK and MFKM) for their in vitro anti-oxidant and anticancer activity against U373MG cell lines. Methods: In vitro antioxidant activity of extracts and fractions was determined by DPPH Radical assay. Reducing power assay, Inhibition of lipid peroxidation, Superoxide radical scavenging assay and Hydroxyl radical scavenging assay. Cytotoxic effect of MK extracts and fractions was evaluated by performing Sulphorhoda­mine B (SRB) assay and Flow cytometry analysis on U373MG cell lines. Results: Extracts and fractions of MK were found to possess significant antioxidant activity. In SRB colorimetric assay, the efficacy of MK against U373MG cell line was observed due to reduced viability of U373MG cells. Dose dependent significant increase in the percentage of dead cells was also observed. MEMK exhibited significant cytotoxicity than EEMK whereas EFMK and MFKM were not found to be significantly cytotoxic against U373MG cell lines. Flow cytometry analysis revealed that the effective extract MEMK induces cell death in human glioblastoma cells through apoptotic mode of action. Conclusion: The observed anticancer activity of Murraya koenigii may be due to its antioxidant potential.

Key words: Murraya koenigii, Antioxidant, Anticancer, Glioblastoma, SRB, assay, Flow cytometry.

In vitro antioxidant assay

**DPPH assay**

The scavenging activity was determined by DPPH assay previously reported by Blois (2009). 7.9 mg of DPPH was accurately weighed and dissolved in 100 ml methanol to obtain 200 μM solution of DPPH. Aliquots of different concentrations of extracts (10 µg/ml, 20 µg/ml, 30 µg/ml, 40 µg/ml, 50 µg/ml) and fractions (5 µg/ml, 10 µg/ml, 50 µg/ml, 100 µg/ml, 150 µg/ml, 200 µg/ml) were added to 1 ml of DPPH solution. After incubating test tubes for 30 min in dark, absorbance was measured at 517 nm against blank. Extracts and fractions were compared with standard Quercetin. The radical scavenging activity was calculated from the equation:-

\[ \text{% radical scavenging activity} = \left( \frac{\text{Abs control} - \text{Abs sample}}{\text{Abs control}} \right) \times 100 \]

Abs-Absorbance.

**Reducing power assay**

Reducing power was determined by previously reported method Oyaizu (1986) The different concentrations of extracts (5 µg/ml, 10 µg/ml, 20 µg/ml, 30 µg/ml, 50 µg/ml, 100 µg/ml, 150 µg/ml, 200 µg/ml) were mixed with 2.5 ml phosphate buffer (0.2 M, pH 6.6) and 2.5 ml K₃[Fe(CN)₆] (1%). The reaction mixture was incubated at 50°C for 20 min. After incubation, 2.5 ml of TCA (10%) was added and centrifuged at 7000 rpm. for 10 min. 2.5 ml solution from the upper layer was mixed with 2.5 ml distilled water and freshly prepared 0.5 ml FeCl₃ (0.1%). Extracts and fractions were compared with standard Quercetin. Higher absorbance of the reaction mixture indicated greater reducing power.

**Inhibition of Lipid peroxidation**

Freshly excised rat brain was processed to get 10% homogenate in cold phosphate buffer, pH 7.4. Degree of lipid peroxidation was assayed by estimating the TBARS formed. The reaction mixture contains 0.1 ml of different concentrations of extracts (10 µg/ml, 20 µg/ml, 30 µg/ml, 40 µg/ml, 50 µg/ml) and fractions (5 µg/ml, 10 µg/ml, 50 µg/ml, 100 µg/ml, 150 µg/ml, 200 µg/ml) were added to the brain homogenate. 0.2 ml SDS (8.1%), 1.5 ml of acetic acid (20%) solution and 1.5 ml of aqueous solution of TBA (0.8%) were added to the homogenate mixture. The mixture was finally made up to 4.0 ml with distilled water, and heated at 95°C for 60 min. After cooling with tap water, 1.0 ml of distilled water and 5.0 ml of mixture of n-butanol and pyridine (5:1) were added, and the mixture was shaken vigorously. After centrifugation at 4000 rpm for 10 min, the absorbance of the organic layer (upper layer) was measured at 532 nm. Extracts and fractions were compared with standard Quercetin. Higher absorbance of the reaction mixture indicated greater reducing power.

**In vitro cytotoxicity evaluation**

**Cell culture and experiment design**

The cell lines (U373MG) of glioblastoma human tissue origin) were grown in RPMI 1640 medium containing 10% fetal bovine serum and 2 mM L-glutamine. For present screening experiment, cells were inoculated into 96 well microtiter plates in 100 μl. After cell inoculation, the microtiter plates were incubated at 37°C, 5% CO₂, 95% air and 100% relative humidity for 24 h prior to addition of experimental drugs. Extracts EEMK, MEMK, alkaloid fractions EFMK, MFMK and standard Adriamycin (ADR) were initially solubilized in dimethyl sulfoxide (DMSO) at 100 mg/ml and diluted to 1 mg/ml using water and stored frozen prior to use. At the time of drug addition, an aliquot of frozen concentrate (1 mg/ml) was thawed and diluted to 100 µg/ml, 200 µg/ml, 400 µg/ml and 800 µg/ml with DMSO. Aliquots of 10 µl of these different drug dilutions were added to the appropriate micro titer wells already containing 90 µl of medium, resulting in the required final drug concentrations i.e.10 µg/ml, 20 µg/ml, 40 µg/ml, 80 µg/ml.

**Sulforhodamine B assay**

Sulforhodamine B (SRB) assay was developed by Skehan and colleagues to measure drug-induced cytotoxicity and cell proliferation for large-scale drug-screening applications. Its principle is based on the ability of the protein dye sulforhodamine B to bind electrostatically and pH dependent on protein basic amino acid residues of trichloroacetic acid-fixed cells. Under mild acidic conditions it binds to and under mild basic conditions it can be extracted from cells and solubilized for measurement. After incubation for 48 h assay was terminated by the addition of cold TCA. Cells were fixed in situ by the gentle addition of 50 µl of cold 30% (w/v) TCA and incubated for 60 min at 4°C. The supernatant was discarded; the plates were washed five times with tap water and air dried. Sulforhodamine B (SRB) solution (50 µl) at 0.4% (w/v) in 1% acetic acid was added to each of the wells, and plates were incubated for 20 min at room temperature. After staining, unbound dye was recovered and the residual dye was removed by washing five times with 1% acetic acid. The plates were air dried. Bound stain was subsequently eluted with 10 m Mtrizma base, and the absorbance was read on a plate reader at a wavelength of 540 nm with 690 nm reference wavelength.
Cell cycle analysis

The cell cycle analysis by Flow cytometry is the primary method of choice, which allows measuring of drug potency, selectivity and mechanism of action. Fluorescent dye such as Propidium iodide intercalates between the double stranded nucleic acid to produce red fluorescence. It also binds to double stranded RNA so as to be removed by RNase. It is important that the cells must be fixed or permeabilised to allow access of the dye because it is not able to penetrate an intact membrane. This dye can be used to determine quantity of cellular DNA and also distribution of cell cycle in population of interest.

U373MG cells were plated at a density of 1.5×10^6 cells in a 10 cm dish. Next day, cells were treated with different doses of extracts. After 24 h incubation, cells were harvested and suspended in 1X-PBS containing 2% FBS. The cells were fixed with 70% ethanol at 4°C for 1 h followed by the addition of propidium iodide (5 μg/μl) and RNase (10 μg/μl) and further incubated for 3 h at 4°C. The DNA content was evaluated in a flow cytometer (BD FACS Calibur, USA). The data was analyzed using Modfit software (BD, Biosciences, USA)

RESULTS

DPPH assay

EEMK, MEMK, EFMK and MFMK showed promising free radical scavenging effect on DPPH radical in a concentration dependent manner. The IC_{50} values of EEMK and MEMK were found to be 10.54 µg/ml and 69.89 µg/ml respectively (Figure 1). The IC_{50} values of EFMK and MFMK were found to be 65.05 µg/ml and 63.00 µg/ml respectively (Figure 2). The extracts were compared with standard Quercetin having IC_{50} value of 17.42 µg/ml.

Reducing power assay

Reducing power of MEMK was found to be higher than EEMK at 10 µg/ml, 20 µg/ml, 30 µg/ml, 40 µg/ml, 50 µg/ml (Figure 3) whereas reducing power of EFMK was found to be higher than MFMK at, 10 µg/ml, 50 µg/ml, 100 µg/ml, 150 µg/ml, 200 µg/ml (Figure 4). Both the extracts and fractions were compared with the reducing power of standard Quercetin.

Inhibition of Lipid peroxidation assay

EEMK, MEMK, EFMK and MFMK elicited concentration dependent inhibition of FeSO_4 induced lipid peroxidation in rat brain homogenate. The IC_{50} values of EEMK and MEMK were found to be 29.8 µg/ml and 33.9 µg/ml respectively (Figure 5). The IC_{50} values of EFMK and MFMK were found to be 84.7 µg/ml and 67.4 µg/ml respectively (Figure 6). IC_{50} value of Quercetin was found to be 60.07 µg/ml

Superoxide scavenging assay

EEMK, MEMK, EFMK and MFMK showed free radical scavenging effect on superoxide radical in a concentration dependent manner. The IC_{50} values of EEMK and MEMK were found to be 13.5 µg/ml and 9.33 µg/ml respectively (Figure 7). The IC_{50} values of EFMK and MFMK were found to be 31.91 µg/ml and 22.62 µg/ml respectively (Figure 8). The extracts and fractions were compared with standard Ascorbic acid having IC_{50} value of 4.87 µg/ml.

Hydroxyl scavenging assay

The IC_{50} values of EEMK and MEMK were found to be 10.9 µg/ml and 45.2 µg/ml respectively (Figure 9). The IC_{50} values of EFMK and MFMK were found to be 96.1 µg/ml and 75.5 µg/ml respectively (Figure 10). The extracts and fractions were compared with standard Ascorbic acid having IC_{50} value of 4.7 µg/ml.

Sulphorhodamine B assay

The GI_{50} value of MEMK and EEMK was found to be 15 µg/ml and 26.7 µg/ml respectively when compared with standard anticancer drug ADR

having GI₅₀ value of less than 10 µg/ml (Figure 11). EFMK and MFMK did not show any significant cytotoxic activity (Figure 13b). These results indicate that MEMK extract was found to be more potent than EEMK showing less GI₅₀ value (Figure 12). Fractions EFMK and MFMK did not inhibit the cell growth in cytotoxicity assay.

**Cell cycle analysis**

Analysis of DNA cell cycle before treatment of EEMK and MEMK shows two different types of cell cycles i.e. diploid and aneuploid cells. (Figure 13a) Diploid cell cycle was found to be 30.47% of total cell population. Large peak corresponds to G0/G1 phase (red color) with 48.42% cells. Small peak corresponds to G2/M phase (red color) with 13.36% cells. Line represents S phase with 38.22% cells. Aneuploid cell cycle was found to be 69.53% of total cell population. Largest peak corresponds to G0/G1 phase (yellow color) with 66.67% cells. Small peak corresponds to G2/M phase (yellow color) with 8.06% cells. Lined area represents S phase with 25.27% cells. Analysis of DNA cell cycle after treatment with MEMK shows presence of apoptotic cells (Figure 13b) along with diploid and aneuploid cells. Diploid cell cycle comprises of 49.44% of total cell population. Large peak G0/G1 phase (red color) corresponds to 28.17% cells. Small peak represents G2/M phase (red color) with 2.15% cells. Lined area represents S phase with 69.68% cells. Aneuploid cell cycle consists of 50.56% of total cell population. Largest peak represents G0/G1 phase (yellow color) with 53.16% cells. Small peak represents G2/M phase (yellow color) with 6.73% cells. Lined area represents S phase with 40.11% cells. Blue color peak indicates apoptotic cells with 14.68%.

After treatment with EEMK, no significant change in the number of cells found in Diploid and Aneuploid cell cycle was observed when compared with DNA cell cycle analysis before treatment (Figure 13c). These results indicate that MEMK showed induction of apoptosis cells whereas EEMK was not found to induce apoptosis in glioblastoma cell lines.

**DISCUSSION**

In the present study, the antioxidant potential of EEMK, MEMK, EFMK and MFMK was evaluated with the help of *in-vitro* antioxidant models like DPPH free radical scavenging activity, Reducing power assay and Lipid peroxidation, Superoxide radical scavenging activity and Hydroxyl radical scavenging activity.

Free radical scavenging activity of the extracts and fractions was evaluated based on their ability to scavenge DPPH. Bleaching of DPPH absorption is a representative of the capacity of the test drug to scavenge free radicals independently. Here, EEMK, MEMK, EFMK and MFMK presented good scavenging of DPPH free radical which might be due to their ability to transfer electrons to the DPPH radical thereby showing reduction in absorbance.

In reducing power assay, the antioxidants in extracts and fractions brought about reduction of Fe³⁺ to Fe²⁺. The amount of Fe²⁺ formed was monitored by measuring the formation of Perl’s Prussian blue at 700 nm. Increasing absorbance indicated an increase in the reducing power of extracts and fractions.

In the current method effectiveness of EEMK, MEMK, EFMK and MFMK is evaluated as inbition of lipid peroxidation. Extracts and fractions reduced the initiating perferryl radical with the formation of ubisemiquinone and H₂O₂. Additionally, it is possible that they might have also eliminated lipid peroxyl radicals. Extracts EEMK and MEMK were found to be exerting more potent antioxidant effect in preventing lipid peroxidation than standard Quercetin.

Extracts and fractions exhibited a dose dependent increase in superoxide scavenging activity. MEMK showed stronger superoxide radical scavenging activity than EEMK The fractions exhibited poor scavenging activity as compared to extracts EEMK, MEMK and standard Ascorbic
During evaluation of anticancer activity, in SRB assay, more significant increase in the percentage of dead cells in U373MG glioblastoma cell lines were observed after treatment with MEMK as compared to treatment with EEMK and fractions EFMK and MFMK, suggesting cytotoxic activity of MEMK.

In Flow cytometry analysis, apoptotic cells were found to be present after treatment with MEMK which were not observed on treatment with EEMK and fractions EFMK and MFMK. Thus, flow cytometry analysis further confirmed that the observed cytotoxic effect of MEMK was due to apoptotic mode of action.

We found that the methanolic extract of curry leaves significantly decreased cell growth in human glioblastoma cell lines in a dose-dependent manner whereas alkaloid fractions of the Ethanolic and methanolic extract of Murraya koenigii were not found to exhibit significant anticancer effect on glioblastoma cell lines.

In conclusion, Murraya koenigii plant extracts and fractions have potent antioxidant activity which might be useful in preventing oxidative stress during cancer treatment. Among both the extracts and fractions, MEMK has ability to produce significant death of U373MG cells whereas its alkaloid fraction has failed to show cytotoxic effect. Hence active component(s) other than alkaloids from methanolic extracts of curry leaves could be responsible for the observed anticancer effect against glioblastoma. In future, if phytoconstituents responsible for anticancer effect on glioblastoma cell line are identified and isolated it could lead to development of novel natural remedy against glioblastoma. Therefore, curry leaves appear to be a promising source of drug candidate for restricting the growth of glioblastoma cancer cells.
