Gymnema sylvestre (Gurmar): A Potent Herb with Anti-Diabetic and Antioxidant Potential

Suparna Laha, Santanu Paul*

ABSTRACT

Introduction: Diabetes Mellitus is a metabolic disorder with high blood sugar level. Type 2 is the common form. The herbal remedies for diabetes treatment is an area of research with a huge potential for the progress in the growth of inexpensive alternative medicine with low or no side effects. In this paper, reviews mainly focused on traditionally used medicinal herb, Gymnema sylvestre and its bioactive components and their mode of actions. Method: Relevant information was collected from scientific journals, research papers, books and various medicinal reviews. Result: This review provides a comprehensive report on Gymnema sylvestre having anti diabetic and antioxidant activity due to its bioactive compounds like oleanines (Gymnemic acid, Gymnema saponins), dammarenes (Gymnemasides), anthraquinones, flavones, hentriacontane, pentatriacontane, phytin, resin, tartaric acid, formic acid, butyric acid, lupeol, Δ-amyrene related glycosides and anthraquinones, alkaloid like gymnaminone, flavonoids, cinnamic acid, folic acid, ascorbic acid etc. Conclusion: Considering the presence of bioactive compounds present in Gymnema sylvestre, this review is aimed to summarize the information of the chemical constituents and their anti diabetic activities and specially to detect the relation between antioxidants and anti diabetic compounds regarding blood sugar reduction in diabetes.

Key words: Gymnema sylvestre, Alternative Medicine, Bioactive compounds, Anti-diabetic, Antioxidant.

INTRODUCTION

Type 2 Diabetes Mellitus is increasing alarmingly day by day. Starting from aged persons to young ones even children are also suffering from this epidemic disorder. Type 2 diabetes is a metabolic disorder which is characterised by hyperglycemia resulting from defective insulin secretion, resistance to insulin action or both.1-3 Hyperglycemia occurs when blood sugar levels become too high (above 200mg/dl). Some other factors like consumption of more carbohydrates than usual, less or no physical activity, being ill or having an infection, increase in stress, not getting proper dose of medicines etc. are also responsible for causing this. In early stage different symptoms like frequent urination, increased thirst, blurred vision, fatigue, headache, etc. are noticed. Later if untreated, other complications crop up like fruity-smelling breath, nausea, vomiting, shortness of breath, dry mouth, weakness, confusion, coma, abnormal activity. Long term damage of target organs like heart, kidney and nerves leading to cardiovascular complications, diabetic neuropathy (damage of nerve cells), kidney damage or Congestive Kidney Failure (CKF), diabetic retinopathy (damage of retinal blood vessels), cataract, diabetic foot infection, bone and joint problems etc. also develop. Generally, simple carbohydrate, Glucose formed from complex carbohydrates is directly absorbed into the bloodstream but cannot enter the body cells without the help of insulin. Insulin plays a vital role in controlling high blood sugar level. Any defect in insulin production and action leads to serious metabolic disorders. Insulin in normal dose is not able to activate the cells to take up the glucose. So, they want more amount of insulin for cell’s sensitization and thereby help to transport a special transporter, GLUT 4 and Hexokinase to the cell surface. GLUT 4 is found in adipose tissues and skeletal/cardiac muscles and is known to be responsible for the regulation of cellular glucose uptake upon stimulation caused by external factors, such as insulin and exercise.4-5 Various factors like Genetic factors, environmental factors, metabolic hormones (leptin, adiponectin, glucagon), excess nutrients, systemic free fatty acids, ER stress / oxidative stress, adipose hypoxia etc. play the role for generation of insulin resistance. Various chemical medications like insulin therapy, acarbose, miglitol (Alpha Glucosidase Inhibitors), metformin (Biguanides), dopamine agonist (Bromocriptine), DPP-4 inhibitors, glucagon like peptides, SGLT-2 inhibitors, etc. are used to cure this disease but due to their critical and deleterious complications and reported side-effects (skin rash, sickness with alcohol, kidney damage, gas, bloating, diarrhea, stomach upset, etc.) people are being scared to use it.6-7
Oxidative stress is also related with long term complications (development of vascular complications) of Type 2 diabetes. Oxidative stress is used to describe the high level of oxidative damage in a cell, tissue or organ, caused by the ROS (Reactive Oxygen Species) and imbalance between the Reactive species (RS) and antioxidants result in the development of Type 2. Oxidative stress in diabetes causes alteration in enzymatic systems, lipid peroxidation, impaired glutathione metabolism and low level of Vitamin C. ROS is responsible for damaging lipids, proteins and DNA, Glutathione, Catalase and Superoxide Dismutase (SOD) that are different types of bio-markers of oxidative stress in Diabetes Mellitus. Three factors are responsible for creating ROS like i) increasing oxidant generation, ii) lowering anti-oxidant protection and iii) failure to repair oxidative damage. Both ROS and RNS (Reactive Nitrogen Species) are types of free radicals which have got negative regulation on insulin signalling, interpreting them to develop insulin resistance which is a risk factor for Type 2 Diabetes. RNS has same type of functions as ROS like lipid peroxidation, non-enzymatic protein glycation and glucose oxidation. Keeping in mind of all above facts, researchers are involved in discovering of a new herbal product with features like its availability, cheaper cost and non-toxic in nature.

Gymnema sylvestre is an important herb in the treatment of Type 2 DM due to the presence of oleanane, dammarane types of secondary metabolites and antioxidants like flavonoids, cinnamic acid, folic acid, ascorbic acid etc. along with potential health benefit and with fewer side effects or no effects. So, Gymnema can be used as an alternative medicine.

About Herbal Medicine
Phyto-medicine or Botanical medicine is popularly called as “Herbal Medicine” because various plant parts like seeds, berries, roots, leaves, bark or flowers, etc. are used for medicine preparation. Use of herbal medicine is becoming popularized as up-to-date analysis and experiment show their importance in the treatment and prevention of diseases due to their natural origin and less side effects. The World Health Organization (WHO) has listed 21,000 plants that are used for medicinal purposes throughout the world. It is validated in science due to its active phytochemical ingredients. Before herbal medicine preparation or formulation, herbalists must have necessary information about its cultivation, collections, processing, diagnosis, extraction of active phytochemicals, etc. India stands to become a significant and successful exporter of herbal crude extracts. Indian herbal market is providing a good source of income to both farmers and traders. For encouraging the use of herbs in developed countries, some precautions should be followed like well documentation about herbal medicine, single plant medicine free of pesticides, heavy metals, poisons and detrimental side effects. Herbal medicines should be of user friendly and with standardized chemical and activity profile.

METHODOLOGY
Data obtained from various sources like Research Gate, PubMed, Science Direct, etc. for studies focusing on the biological and pharmacological activities of Gymnema sylvestre. Different literature and review articles on Gymnema are studied about its phytochemical constituents and their anti-diabetic and antioxidant activities, parts use, method of use, color, taste, duration of use, etc. The list of references of all relevant articles was also studied to include all reports and reviews related to the matter.

Cultivation
Gymnema sylvestre reproduces vegetatively through stem cuttings and sexually through seeds. Seeds are sown in the month of November and December and are harvested after 8-9 months. Seed viability is very short but their highest germination (92%) is shown when sown in coir dust. Improved agro techniques (in-vitro regeneration, cell culture) have been followed for their better cultivation.

Geographic Distribution
Gymnema sylvestre has worldwide distribution. It occurs from Africa east to Saudi Arabia, Vietnam, Sri Lanka, South China and from Japan to Philippines, Malaysia, Indonesia, Australia and in dry forests throughout India. In India, it is distributed in Banda, Konkan, Western Ghats and Deccan Peninsula extending to the parts of Western and Northern India.

Traditional Use
According to Sushruta, Gymnema sylvestre was used as sugar destroyer (due to chewing of leaves which destroys the ability to identify the sweet taste) in case of glycosuria and other urinary diseases. Various reports are obtained on its nature like bitterness, astringent, thermogenic activity, anti-inflammatory, digestive, liver tonic, diuretic, stomachic, stimulant, anthelmintic, laxative, cardio tonic, anti-pyretic and uterine tonic, etc. It is useful in dyspepsia, constipation, hepatitis, hemorrhoids, renal and vesicle calculi, cardiopathy, asthma, bronchitis, amenorrhea, conjunctivitis and leukoderma.

Bio Active Antidiabetic and Antioxidant Compounds

Antidiabetic compounds
In Gymnema sylvestre various secondary metabolites are present. Such metabolites are oleane saponins and dammarane saponins. Oleane saponins are of two types i.e. gymnemic acid (Figure 1) and gymmema saponins. Gymnemasaponins consists of two aglycone saponins like gymnemagenin and gymnestrogenin. (Figure 1). Dammarane saponins include gymnemasides (I-VII). All of these secondary metabolites have antidiabetic properties. Besides these triterpenoid saponins other antidiabetic constituents are anthraquinone, flavones, flavonoids like epicatechin, apigenin, luteolin, kaempferol, hentriacontane, pentatriacontane, phytin, resins, tartaric acid, formic acid, butyric acid, lupeol, β-amyrin related glycosides. Anthraquinones and their derivatives, alkaloids-conduritol, gymnamine, α and β chlorophyll, polypeptide (Gurmarin), d-quercitol, stigmasterol, nonacosane, parabin, calcium oxalate, cellulose, lignin etc. also possess antidiabetic potential.

Antioxidant compounds
Flavonoids, tannins, alkaloids, phenols, cinnamic acid, folic acid, ascorbic acid, butyric acid, tartaric acid etc. type of antioxidants are present in Gymnema sylvestre.

![Figure 1: Chemical structure of the important bioactive molecules from Gymnema sylvestre.](image-url)
Chemical Structure of Bioactive Compounds

In case of Gymnema sylvestre, gymnemic acids are triterpenoid glycosides. The central structure is aglycone gymnemagenin. This is adorned with a sugar such as glucoronic acid and with various ester groups. Gymnemic acid is not a pure, unique structure but is composed of several types of homologues or compounds of the same general formula. Gymnemic acid A comprises of A1, A2, A3 and A4. The aglycone gymnemagenin is a D-glucoronide of hexa-hydroxytriterpene. Gymnema saponin iii is another anti-sweet compound which consists of 23 hydroxy longispinogenin as the aglycone moiety. Another antidiabetic compound, dammarane is a tetracyclic tri-terpene saponin. Seven new dammarane saponins, named Gymnemasides i-vii have been isolated from leaves of Gymnema sylvestre, together with previously known dammarane type saponins, gypenoside XXVIII, XXX-VII, LV, LXII, LXIII. Anti-oxidants such as Terpenoids are unsaturated hydrocarbons with oxygen containing functional group derived from terpenes. Flavonoids have 15 carbon skeleton structure that consists of two phenyl rings (A and B) and heterocyclic ring(C). Cinnamic acid is white crystalline organic compound which is highly soluble in organic solvent. It is classified as an unsaturated carboxylic acid. Another antioxidant, folic acid also called as Vitamin B9, is white and crystalline compound. It is also known as phenolic acid or pteroglutamic acid. Tannins are esters of phenolic acid containing hydroxyl and carboxyl groups. Phenols are aromatic, white crystalline compounds where hydroxyl group is attached with carbon atom that is part of an aromatic ring.

Essential Chemical Components of Gymnema sylvestre and its Mode of Action in Downregulating Blood-Glucose Level

Proposed mechanism for the hypoglycemic action of gymnemic acid might be increased secretion of insulin from the pancreas and promotion of islet cell regeneration. Hypoglycemic effects of gymnemic acids are: i) it increases insulin secretion ii) it promotes regeneration of islets cells iii) it increases glucose utilisation, it is shown to increase the activities of enzymes responsible for utilisation of glucose by insulin dependent pathways, an increase in phosphorylase activity, decrease in gluconeogenic enzymes and sorbitol dehydrogenase. iv) It causes inhibition of glucose absorption from intestine. Gymnemic acid binds to the receptor on the intestine and stop glucose molecule from binding to the receptor and thus prevent excess glucose absorption. Gymnemic acid binds to Na+ glucose symporter in intestine thereby prevent glucose absorption (Figure 2).

In case of gynemasaponins, anti-sweet activity is also developed due to the presence of Acyl group, so it is an aglycone part of saponin. It also increases the amount of insulin in blood plasma. Gymnemagenin has anti hyperglycemic activity. Gymnestrigenin's other antidiabetic activities still not observed from various literature. Antidiabetic activities of various bioactive components are very much essential for Type 2 diabetes control (Table 1).

Antidiabetic compounds such as anthraquinone, flavones, flavonoids like epicatechin, Apigenin, Luteolin, Kampferol, Hentriacontane, Pentri-accontane, Phytin, Resin, Lupeol, β-amyrene related glycosides, alkaloid (conduritol), a and β- chlorophyll, Stigmasterol, d-querctol, Nonacosane, Lignin etc. also have antioxidant activities.

Antioxidant like ascorbic acid neutralizes hydroxyl radicals, super oxide radicals thereby proving its antioxidant nature and also showing blood sugar uptaking abilities. Both antioxidant and antidiabetic function is very helpful in Type 2 diabetes treatment. Other antioxidants like Terpenoid, Flavonoid, Cinnamic acid, Folic acid, Tannin, Phenol etc. also perform antidiabetic as well as antioxidant activity.

As antidiabetic components of Gymnema show antioxidant activities vice versa antioxidants also show their antidiabetic potential (Table 2).

RESULT AND DISCUSSION

Based on various scientific literature, it has been proved that Gymnema sylvestre is one of the most important herb with antidiabetic and anti-

ANTIOXIDANT AND ANTI-DIABETIC ACTIVITIES

- Neutralise hydroxyl, superoxide and hydrogen peroxide radicals.
- Glucose uptake activity. Increase insulin sensitivity to diabetic patients.
- Scavenging free radicals and Glucose lowering activity.
- Scavenging SOD, H₂O₂ and having reducing power ability. Reduction of blood glucose and Glucose absorption in intestine. Stimulation of insulin secretion from β cell, glucose uptake and Inhibition of a-amylase and α-glucosidase.

CONCLUSION

Antidiabetic activity along with antioxidant potential of Gymnema sylvestre R.Br. have been reported till date due to the presence of flavonoids, phenols and various bioactive compounds like gymnemic acid, gymnenmarierin and other secondary metabolites like saponins, tannins (phenolic compounds) and triterpenoids that are antioxidant but show antidiabetic activity also. So, we can conclude from various literature reviews that biocomponents possess both antidiabetic and antioxidant activities and antioxidants with their antidiabetic features also. As diabetes incidence increases day by day, more effective research and assessment or analysis must be required to find out other active phytochemical compounds with exact active antidiabetic mechanism of action for human welfare in near future.

CONFLICT OF INTEREST

There is no conflict of interest.
Gymnema sylvestre is commonly known as gurmar, a medicinally important plant in the treatment of Type 2 diabetes, belonging to the family Asclepiadaceae. Several active compounds like gymnemic acid, gymnema saponins (gymmemagenin, gymnemestrogenin), gymnemamides, anthaquinones, flavones, hericatrioantane, pentatriacontane, phytin, resins, tartaric acid, formic acid, butyric acid, gymnestrogenin, gymnemasides, anthraquinones, flavones, henriciacontane, pentatriacontane, phytin, resins, tartaric acid, formic acid, butyric acid, and lutein have been identified and studied for their various medicinal properties.

Due to the presence of flavonoids, cinnamic acid, folic acid, ascorbic acid etc., Gurmar leaves have high antioxidant activities.
ABOUT AUTHORS

**Dr. Santanu Paul** is a professor at the Department of Botany, University of Calcutta, India. He has experience in isolation and characterization of anti-cancerous novel compounds from medicinal plants and looking at the molecular mechanism of apoptosis induction.
