**INTRODUCTION**

Numerous chemicals are produced by the plants in different concentrations and the relation between these phytochemical, which helps the plants to fight against various diseases and insects. Due to the highly expensive and side effects, the researchers are trying to find the drugs from the plant sources without any toxic effect. The various phytoconstituents are present in the plants, the compounds have various biological activities. The numerous plants and their parts are used for the medicinal purposes from ancient times. In now-a-days the researchers are trying to find the mechanism of action of the phytoconstituents and developed the new drugs, because these are inexpensive and have no side effects.¹

*T. catappa* (T. catappa)

*T. catappa* belongs to the Combretaceae family. It highly distributed in the warmer places of Asia. Its other names are Indian almond, Malabar Almond and Tropical Almond. The plant which contains the various phytoconstituents, especially the leaves contains beta-kaempferol, tert-flavin, gentisic acid and quercetin. The leaves contain the anti-microbial activity,²,³ hepatoprotective activity and anti-diabetic activity.⁴

*T. chebula* (T. chebula)

*T. chebula* belongs to the Combretaceae family. The common name is Haritaki, in Tamil Ammai, Amutam, Aritaki, Pethiyam and Varikkai. The tree consists of fruits, bark and root. It contains various phytoconstituents like triterpenoids, coumarin, gallicacid, ethyl gallate etc.⁵ In an ancient time the fruits are used to reduce the swelling and clean the wounds and ulcers. The recent studies prove that the fruits which have the molluscicidal activity,⁶ antiviral activity,⁷ anti-mutagenic activity, anti-cancer activity⁸ and hepatoprotective activity.⁹

Hence, the present study is aimed to evaluate the anti-oxidant activity of ethanolic extract of *T. catappa* leaves and *T. chebula* fruits in the doxorubicin toxicity rats.

**ABSTRACT**

**Background:** Oxidative stress plays an important role in chronic complications of diabetes, cancer, liver disorder etc. The free radicals such as superoxide anions, hydrogen peroxides are causing the oxidative stress and it involves the cellular damage. Evidences recommended that the natural medicines from plant sources are treated to overcome the oxidative stress complications. **Objective:** The aim of the present is to find the antioxidant activity of the ethanolic extract of *Terminalia catappa* leaves and *Terminalia chebula* fruits in the doxorubicin (DOX) induced toxicity rats. **Methods:** Oxidative stress is induced with a single dose of doxorubicin and then the animals were treated with a dose of various concentration of ethanolic extract of *T. catappa* leaves and *T. chebula* fruits (200, 300 mg/kg/b.w) for 21 days. After the treatment, Lipid peroxide (LPO), Reduced glutathione (GSH), vitamin C, vitamin E, Gluthathione Peroxidase (GPx), Superoxide dismutase (SOD), catalase levels are determined. Propranolol 25mg/kg is used as standard drug. **Results:** In the present study, after the treatment of doxorubicin the levels of SOD, CAT, GSH, GST, GPX, vitamin C, vitamin E levels are decreased and LPO level is increased. After the treatment of *T. catappa* leaves and *T. chebula* fruits the levels were returned to the normal level. **Conclusion:** The results proved that the ethanolic extract of *T. catappa* leaves and *T. chebula* fruits may protects the cells from oxidative stress induced by the doxorubicin induced toxicity rats.

**Key words:** Oxidative stress, Enzymatic antioxidant, Non-enzymatic antioxidant, Doxorubicin, Terminalia catappa, Terminalia chebula.
MATERIALS AND METHODS

Plant material and extraction

The fresh *T. catappa* leaves (MPP 001) and *T. chebulla* fruits (MPP 002) were collected locally and authenticated by Botanist at Rapinat Herbarium, St. Joseph College, Trichy, Tamil Nadu, India. The extraction of *T. catappa* leaves and *T. chebulla* fruits are done by a hot percolation method with Soxhlet apparatus. Ethanol is used as a solvent. About 100 gm of the powdered plant materials is extracted with 600 ml of ethanol. The extract is concentrated to dryness under controlled temperature of 40–50°C. Animal’s Male albino rats of 6–8 weeks age, weighing 150-180 g is used. The animals are kept in clean, dry plastic cages and fed with standard pellet diet and water. This study is carried out in the animal house of Srimad Andavan Arts and Science College, Trichy and this study is approved by the Institutional Ethical Committee. (CPCSEA Approval No: 790/03/ac/CPCSEA) The animals are divided into nine groups with six rats each.

Biochemical analysis

The antioxidant status is assessed in the cardiac tissue of the experimental rats. A known weight of the tissue was homogenized in 0.1 M ice cold tris–HCl buffer (pH 7.5) to give a 10% homogenate and used as the source of anti-oxidants. The levels of LPO, CAT, GPx, and GST were estimated in the cardiac tissues of control and experimental group of rats.

Statistical analysis

Data were analyzed by one way analysis of variance (ANOVA) followed by Duncan’s multiple range test (DMRT) using a commercially available statistics software package (SPSS® for Windows, V. 17.0, Chicago, USA). Results were presented as means±SD for six rats in each group. Values not sharing a common marking (a,b,c…..) differ significantly at p ≤ 0.05 (DMRT).

RESULT AND DISCUSSION

Table 1 shows the levels of enzymatic (SOD, CAT, GPx and GST) and non-enzymatic anti-oxidants (LPO, GSH, vitamin C and vitamin E) in control and the experimental groups. A significant decrease was noted in the level of both enzymatic and non-enzymatic anti-oxidants were noted in DOX induced rats and the LPO level is increased when compared with the control. After the treatment of Ethanolic extract of *T. catappa* leaves, *T. chebulla* fruits and isopropranolol increased the anti-oxidants level near to the normal in a dose dependent manner. The higher concentration of 200 mg/kg of the extracts of both the plants. According to the present results, *T. chebulla* fruits have a maximum effect than that of the *T. catappa* leaves on enzymatic and non-enzymatic anti-oxidants. In the extracts alone treated group results similar to the control group.

The DOX in the cardiac muscles is converted into the semi quinone form, this is toxic and short lived, it reacts with molecular oxygen and it forms the ROS. DOX and its metabolites reduces the oxidant level and produces the free radical generation in the heart. The previous clinical studies also support the increased oxidative stress associated with DOX causes the cardiomyopathy that leads to the heart failure. In the present study, the enzymatic anti-oxidants of SOD, CAT, GPx, GST and GSH levels are significantly (P<0.05) reduced in the DOX induced animals. After the treatment of *T. catappa* leaves and *T. chebulla* fruits the levels of enzymatic anti-oxidants are returned back to the normal. SOD is an effective anti-oxidant enzyme, it potentially converts the toxic superoxide radical to H₂O₂.In the DOX treated rats, the toxin which increases the lipid peroxidation and it increases the oxidative stress. This reduces the anti-oxidants levels in myocardium. The similar changes are also noted in the previous studies. After, the treatment of *T. catappa* leaves and *T. chebulla* the levels are increased. This may due to the reduction

Figure 1: LPO level in plant extract treated and untreated rats.
Punniyakotti, et al.: T. catappa Leaves and T. chebula Fruits

In the present study, the level of CAT is reduced in the toxin DOX induced rats. After the treatment of T. catappa leaves and T. chebula the levels are returned back to the normal. This may be due to the reduction of oxidative stress by the extracts. The similar effect is noted in the Vennila and Pugalendi (2010) in the sesamol treated rats.

GSH is an important free radical scavenger. Decreased level of GSH reduces the ability of cells and thereby enhances the level of LPO. In the present study, the levels of GSH is reduced in the DOX rats, it may be due to the increasing concentration of LPO. After, the treatment of T. catappa leaves and T. chebula the levels are significantly ($p < 0.05$) increased and it return back to the normal.

Vitamin E is a lipid soluble and Vitamin C is a water soluble anti-oxidants, which are present in the cellular membranes. The vitamin E is mainly involved in the suppression of free radicals and vitamin C is involved in the recycling of vitamin E as the free radical scavenger. Vitamin E and vitamin C are maintained in the active form by GSH. The levels of vitamin E and vitamin C are decreased in the DOX treated rats. The levels are restored to the normal in T. catappa leaves and T. chebula treated rats.

CONCLUSION

The results proved that the ethanolic extracts of T. catappa leaves and T. chebula fruits may effectively regulate the enzymatic and non-enzymatic antioxidant status in the DOX induced toxicity rats. It may be the reason for its various pharmacological properties. On the basis of these findings and other scientific evidences supports T. catappa leaves and T. chebula fruits may be used to treat various disorders due to the imbalance of antioxidant levels.
ACKNOWLEDGEMENT

The authors are greatful to Dr. Sridharan, Srimath Andavan Arts and Science College, Trichy.

CONFLICT OF INTEREST

The authors declare no conflict of interest.

ABBREVIATIONS

T. catappa: Terminalia catappa; T. chebula: Terminalia chebula; DOX : Doxorubicin; ; SOD: Superoxide dismutase; CAT: Catalase; GSH: Reduced glutathione; GST: Gluthathione-S-Transferase; GPx: Glutathione peroxidase; LPO: Lipid peroxide.

SUMMARY

• Terminalia catappa Leaves and Terminalia chebula Fruits have been traditionally used to treat various diseases. In the present findings it has been proved that the both plants have anti-oxidant properties in doxorubicin toxicity.

ABOUT AUTHORS

Dr. Arumugam Vijaya Anand, is an Associate Professor and Head, Department of Human Genetics and Molecular Biology. He has more than 20 years of teaching and research experiences. His area of inter est is Phythopharmacology, Clinical Biochemistry and Medical Genetics.
